As an **Android Developer** I've gone from [Loaders и AsyncTask](#) to [Kotlin Multiplatform](#), through all versions of [RxJava](#).

Able to

- Run fast, on the fly with a yesterday deadline on millions of users.
- Run it slowly, thoughtfully.
- With A/B tests and [trunk based development](#).
- With post-release monitoring and the ability to quickly rollback/switch product features.

Approximately precisely

- Realise when it makes sense to bring RxJava, Kotlin Multiplatform, Dagger and other “modern” power technologies into a project or if WebView with a couple of hacks is enough to launch a product.

Understand and forgive

- When a Device farm on Kubernetes with a complex scheme of CI/CD is needed.
- When one intern and one small script in repository as CI/CD are enough.

Being in charge of a Big fintech product one has to deal with Application Security

- I have been working closely with the AppSec department all the way through.
- I have developed Capture The Flag challenge for the [Qivi Android Developer Days](#) meetup.
- Know how to work with Frida on Android and Ghidra on Ios.

Apart from Android development for the past few years i have been into DevOps trend with its **Kubernetes, Tekton pipelines, Argo CD, Grafana/Kibana** and so on

- Configure and deliver Device Farm on Kubernetes in Qivi.
 - Run Tekton pipelines with a help of ArgoCD and Ansible.
-

Qivi Wallet(2013→2024) *yet in store but in different role Russian government revocation of banking license since 2024, so i am open for an offer*

- March 2013 I joined Android Development team as the second participant where i started to create the first versions of Qivi Wallet.
- 2016 I became the “executing” Android Teamlead.

Contactless Visa payWave service in Qivi Wallet

- Developed and launched contactless payment system Visa payWave with the help of Host Card Emulation technology without using Visa SDK. Implemented the protocol [smartphone] <—> [POS terminal] from scratch. In the application one could issue tokenized card and pay with an NFC equipped phone via POS terminal. It was the first solution on Russian market those days.

Sovest. Loyalty/credit card.

- Developed the first version of Sovest loyalty card app which later split of into a new branch with its own development team.

Qivi Investor

- Launched the first version of Qivi Investor crossplatform app with the use of J2Ob crossplatform library.

Device farm

- Adapted Device Farm for CI/CD processes what i presented the full process on the [Qivi Android Developer Days](#) meetup.

Qivi Support chat

- SDK without UI.
- SDK with UI.
- Crossplatform Android/Ios SDK's [Kotlin Multiplatform](#).

CBDC (Central Bank Digital Currency)

- Developed the first version of Russian CBDC (Digital Currency) project in Qivi Wallet with the use of [Kotlin Multiplatform](#).

Before Qivi (until 2013) used to develop on C++ in GosNIIAs (State Research Institute of Aviation Systems) and on JavaScript in Salesforce integrator “Masterdata”.

Higher education: Moscow Aviation Institute. Faculty of Information Technology (2005-2011).

Random facts

- Twelve years of music school in piano and percussions instruments. Love to play and write music.
- 1.5 year of J2me (Java 1.2) app support and development of app-wrapper for Nokia Asha device based on it.
- Addicted to NeoVim, Arch linux with Hyprlane.
- Had a big macaw bird as a pet.
- Possess a working Jolla Sailfish OS based smartphone. Two Blackberry. Two Samsung Fold.
- Married, raising one year-old daughter. Made the wedding app which is stored in an open repository since 2015 (but the code is better not to be revisioned:)).
- Got a PwC issued MBA certificate back in 2022.
- Gained Domain Driven Design certificate of Luxsoft.
