Qiwi Wallet. (2013->2024) *Android Developer->Android Team Lead*

Status: App **still available in store** despite government license revocation in 2024

Android Evolution

As an Android Developer, I've gone from working with Loaders and AsyncTask to RxJava (all major versions) and now use Kotlin Multiplatform

Key Contributions

- Joined Qiwi in March 2013 as the second Android developer
- Helped build and launch the first production versions of Qiwi Wallet
- Promoted to Android Team Lead in 2016

Visa payWave (Contactless Payments)

- Launched Visa payWave integration via Host Card Emulation (HCE)
- Developed the full [smartphone] ↔ [POS terminal] protocol from scratch
- Enabled in-app issuance of tokenized cards for NFC payments
- One of the first solutions on the Russian market

Sovest (Loyalty / Credit Card)

- Built the first version of the Sovest app
- Product later spun off into a dedicated team and codebase

Qiwi Investor

- Developed the initial cross-platform version of Qiwi Investor
- Used J2ObjC for shared logic across Android and iOS

Device Farm Integration

- Integrated Device Farm on Kubernetes into Qiwi's CI/CD
- Presented the setup at Qiwi Android Developer Days

Support Chat SDKs

- Delivered multiple SDKs:
 - Core SDK (no UI)
 - Full-featured UI SDK
 - Cross-platform Kotlin Multiplatform SDKs for Android & iOS

CBDC (Central Bank Digital Currency)

- Contributed to the first version of Russia's Digital Ruble (CBDC) within Qiwi Wallet
- Used Kotlin Multiplatform for shared codebase

Before Qiwi

- C++ Developer at GosNIIAS (State Aviation Institute)
- JavaScript Developer at Masterdata (Salesforce integrator)

Education

Moscow Aviation Institute

Master's degree in Information Technology (2005 → 2011)

My Engineering Approach

Able to adapt to the pace

- Comfortable working under tight deadlines, even on high-load apps with millions of users.
- Equally confident in taking a slower, more thoughtful approach when code quality and long-term stability matter
- Experienced with A/B testing, [trunk-based development](#), and release monitoring
- Know how to quickly roll back or switch off features after release if needed

Choosing tools with purpose

- I bring in advanced tools like RxJava, Kotlin Multiplatform, or Dagger when the project benefits from them
- But I also know when a simple WebView with some tweaks is enough to test and launch fast
- I aim to use the right tool for the job, not the most complex one

Understand complexity – and when to avoid it

- I've worked with Kubernetes-based device farms, CI/CD pipelines, and production-grade monitoring tools
- At the same time, I appreciate when a small script and one intern can solve the problem more effectively

Security & DevOps Experience

Application Security

Leading a large fintech product means thinking about security every day. I've worked closely with our AppSec team throughout the development process.

- Created a custom Capture The Flag challenge for [Qivi Android Developer Days](#)
- Hands-on experience with Frida (Android) and Ghidra (iOS) for reverse engineering and app security

DevOps & Infrastructure

In recent years, I've also worked on the DevOps side of mobile:

- Set up and delivered a Device Farm on Kubernetes for automated testing
- Managed CI/CD using Tekton Pipelines, Argo CD, and Ansible
- Worked with observability tools like Grafana and Kibana
